SHARPEN YOUR INSTRUMENTS

Why?

Surgical Instruments should be kept identical to their original design. Surgical procedures are most effective when using sharp instruments as they reduce hand and wrist fatigue, improve calculus removal, save time, improve tactile sensitivity, and minimize patient discomfort.

When?

Instruments should be sharpened lightly after each use; there are two ways to evaluate whether the cutting edge is dull and requires sharpening:

- **Visual**: The cutting edge should be inspected regularly in a good light (and if possible, under magnification). If the cutting edge is blunt it will be rounded and reflect the light. A dull, non-reflective line indicates sharpness.
- **Teflon Test Stick** (DB-15): If the blade of the instrument runs smoothly over the testing stick, then it is blunt. A sharp instrument will grab into the stick and removes small fragments of the plastic.

How?

Generally, the instruments should be sharpened following this procedure:

1. Place one drop of sharpening oil (**DB-OL**) on the **Arkansas** sharpening stone. Lubrication improves the movement of the instrument blade over the stone; also, it prevents the metal particles from clogging the stone.
2. Hold the instrument in one hand, while applying the stone to the lateral surface angled with the face of the blade.
3. Position the stone to contact the heel of the blade and work toward the tip, keeping the stone in contact with the blade throughout the sharpening procedure.
4. Move the stone up and down with short strokes, placing more pressure on the down stroke (do not move the instrument, keep the instrument still).
5. Always finish instrument sharpening with a down stroke; this will prevent a rough edge from forming and remove any flash of metal.
6. Evaluate the sharpness with teflon test stick (**DB-15**). If the blade is still dull, re-evaluate the angle of the stone and repeat the sharpening (steps 2-6).

SHARPENING OF SCALERS AND CURETTES

Sickle Scaler Toe End: the sickle scaler has a pointed tip and, therefore, the stone is held straight as it nears the tip.

Curette Toe End: the curette has a rounded toe, so the position of the stone is adapted around the rounded cross-section.

⚠ *Always finish instrument sharpening with a down stroke; this will prevent a rough edge from forming and remove any flash of metal.*

RINSE AND CLEAN

Immediately after surgery, rinse instruments under warm running water (NOT HOT). Use only neutral detergent (pH=7).

ULTRASONIC CLEANING

It is recommended for regular instruments such as hand instruments and extraction forceps, following this procedure:

1. Sort instruments carefully so as to include only instruments compatible with ultrasonic cleaning. Do not combine different metals (stainless, copper, chrome plated, etc.).
2. Place instruments in open position. Make certain sharp edges are not touching other instruments.
3. Change solution frequently to avoid accumulation of micro organisms.
4. After rinsing and before sterilization, inspect and dry the instruments thoroughly.

⚠ *Ultrasonic cleaning does not sterilize.*
Do not use for TC instruments, sharp and delicate instruments.

STERILIZATION

Autoclave (Steam Sterilization)

Time: 4 - 20 min. / Temperature: 130° - 134°C (266° / 273°F)

Chemiclave (Chemical Sterilization)

Time: 4 - 20 min. / Temperature: 130° - 134°C (266° / 273°F)

Dry Heat Sterilization *(not recommended)*

Time: 60 - 90 min. / Temperature: 160° - 170°C (320° / 340°F)

⚠ *Sterilization cannot substitute cleaning.*

CARE OF SHARPENING STONES

After use, wipe the stone with a clean cloth to remove metal particles. Then, clean the stone by scrubbing or using ultrasound to remove lubricant before sterilization. After sterilization, lubricate with **DB-OL** before each use.

⚠ *Be sure to use entire stone to prevent "grooving".*

Visit our web site: **BMTsurgical.com** *for instructions and methods of use.*
